

Based on Parameter Report

BI Publisher / Oracle EBS – Step-by-Step Guide

Step 1: Write the Report Query

In Oracle Reports Builder, define the SQL query that will act as the data source for the report (for example, `SELECT * FROM EMP`). This query determines the fields that will later be available for grouping, sorting, and display.

Step 2: Define the Concurrent Program Executable

In Oracle Applications, create the Concurrent Program Executable. Set the Execution Method to Oracle Reports and enter the Execution File Name that matches the report.

Oracle Applications - EBSDB

File Edit View Folder Tools Window Help

Concurrent Program Executable

Executable	KHEMPPREPORT
Short Name	KHEMPPREPORT
Application	Application Object Library
Description	
Execution Method	Oracle Reports
Execution File Name	KHEMPPREPORT
Subroutine Name	
Execution File Path	

Stage Function Parameters

Open

Step 3: Define the Concurrent Program

Create the Concurrent Program (e.g. KHEMPPREPORT) and link it to the executable defined in the previous step. Set the Output Format to XML so that running the program produces an XML data file.

☐ Request On Hold ☐ Program Completed ☐ Request Completed (Z)

☐ Request Resumed ☐ Post Processing Started

Copy to... Session Control Incompatibilities Parameters (G)

Step 4: Add the Program to a Request Group

Attach the new concurrent program to the relevant Request Group so that it becomes available for users to run from the Requests window.

Program	KHADIJAPARAMETERREPORT	Application Object Library
Program	KHADIJA_PR_FACTORIAL	Application Object Library
Program	KHEMPPREPORT	Application Object Library
Program	KHADI_MASTER_DETAIL	Application Object Library
Program	KHADIJA_MASTER_NEWONE	Application Object Library

Description

Step 5: Submit the Request

From the Requests window, submit a new request for the concurrent program and monitor its Phase and Status until it completes with a Normal status.

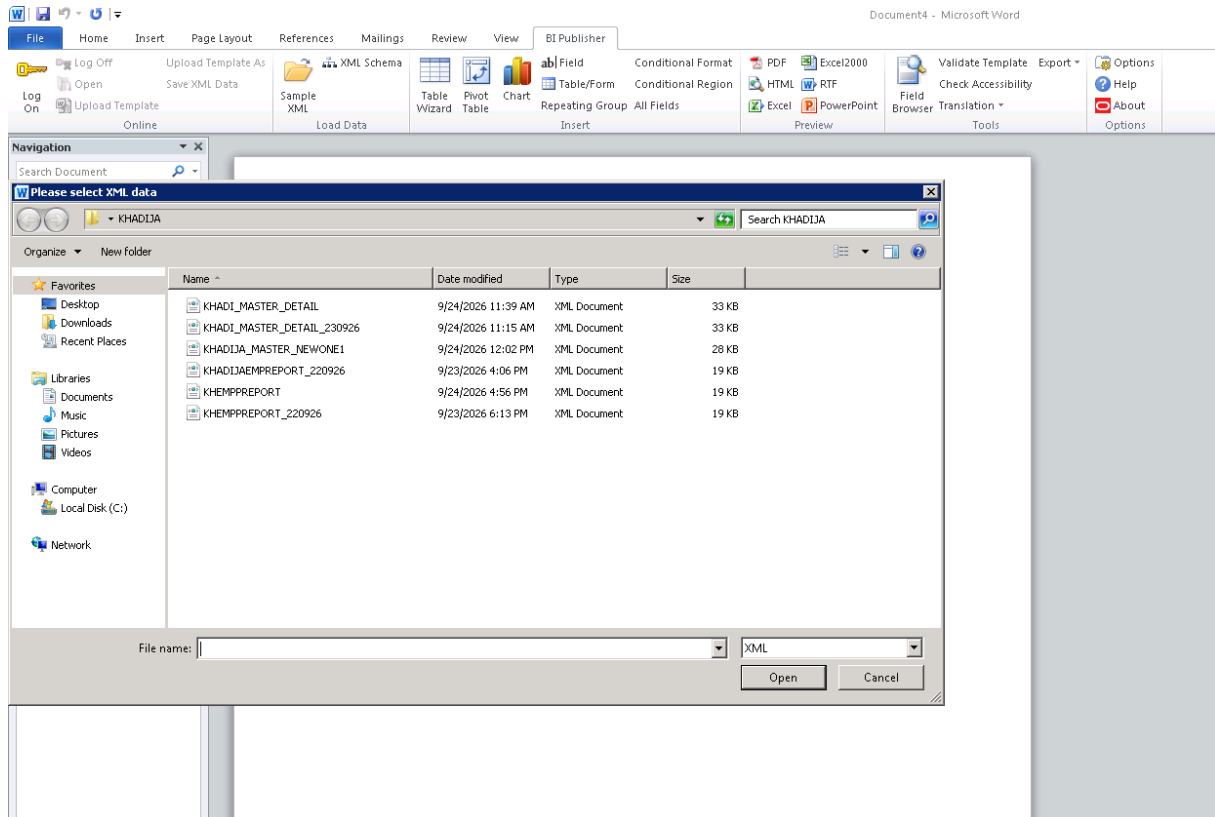

Step 6: View the Generated XML Output

Once the request completes, open the XML output file produced by the concurrent program. This XML file contains the sample data that will be used to build the report template.

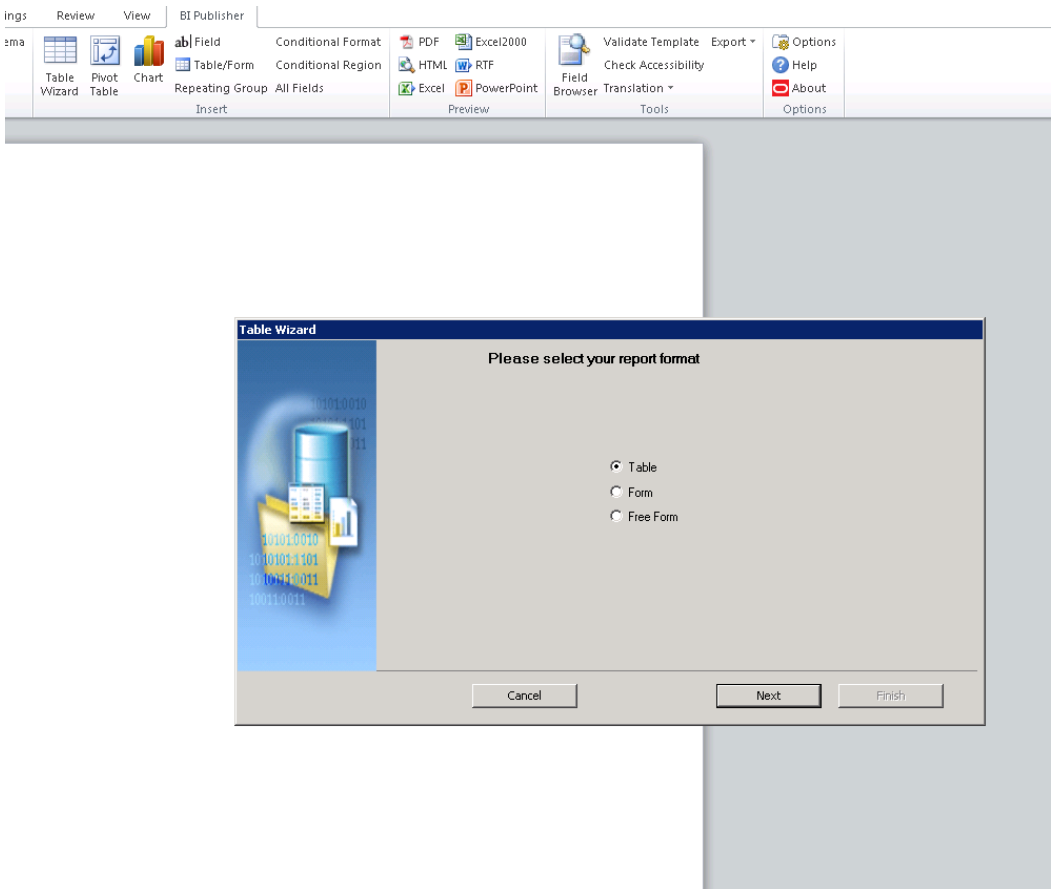

Step 7: Load the Sample XML in MS Word

In MS Word, use the BI Publisher ribbon and select the XML file generated in the previous step as the Sample XML data for the template.

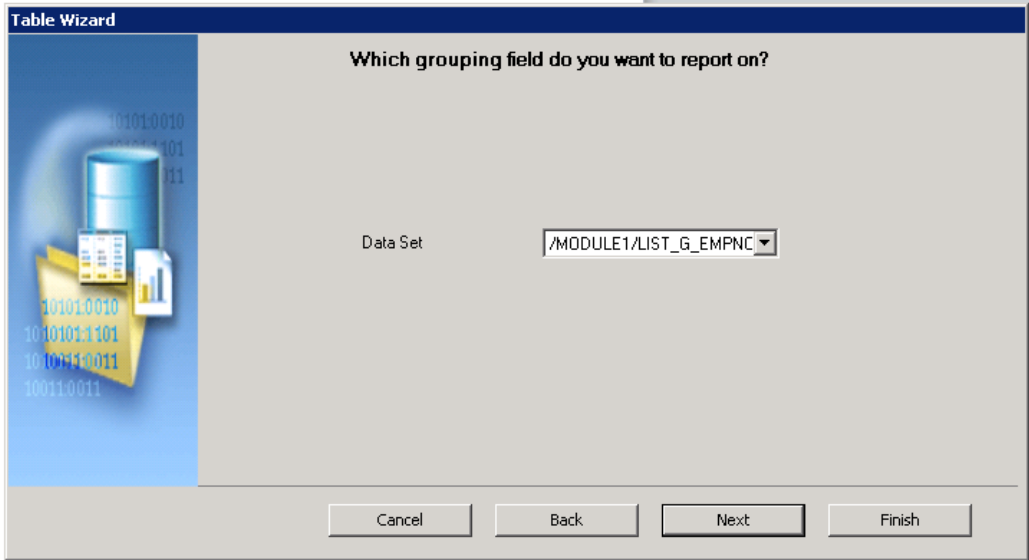

Step 8: Launch the Table Wizard and Select the Report Format

Open the Table Wizard from the BI Publisher ribbon and choose Table as the report format for the layout.

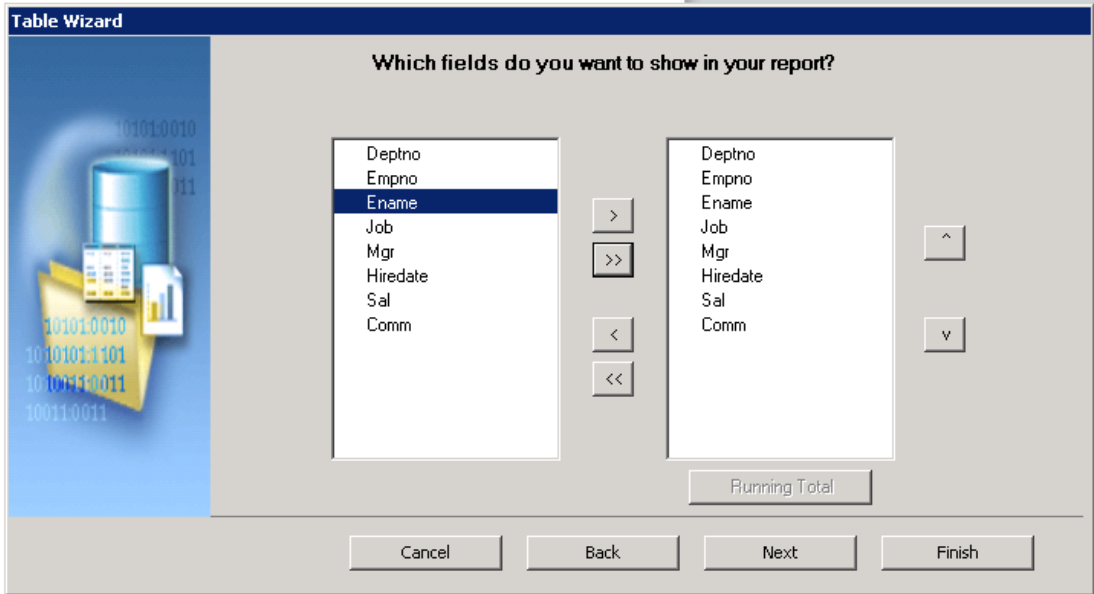

Step 9: Click Next

Click Next to continue to the next step of the wizard.

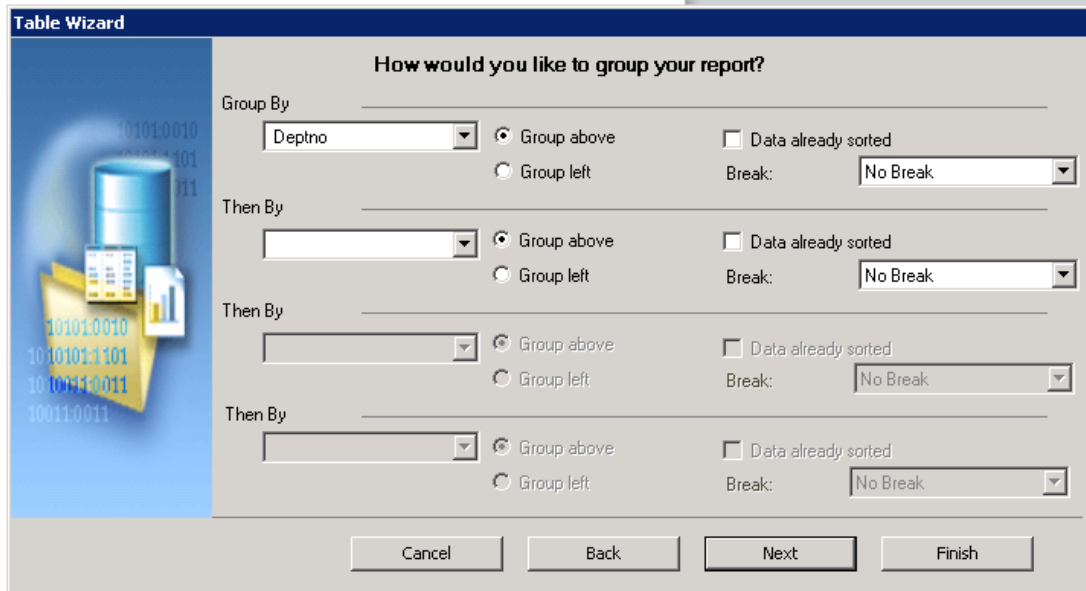

Step 10: Select the Fields to Show in the Report

Choose which fields should appear in the report output, such as Deptno, Empno, Ename, Job, Mgr, Hiredate, Sal, and Comm, and move them into the selected list.

Step 11: Group the Report by DEPTNO

In the grouping step of the Table Wizard, set Group By to Deptno so the report data is organized by department number.

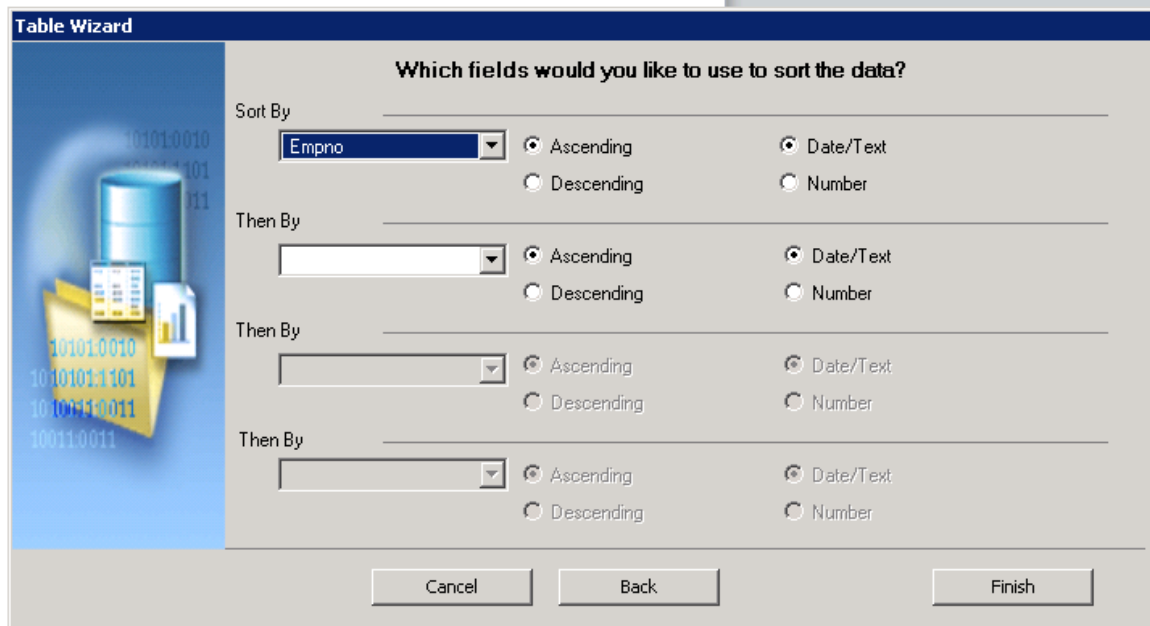

The screenshot shows the 'Table Wizard' dialog box, specifically the 'How would you like to group your report?' step. The dialog has a blue header bar with the title 'Table Wizard'. On the left side, there is a graphic of a blue database cylinder and a yellow folder containing documents, with binary code (0s and 1s) floating around. The main area is titled 'How would you like to group your report?'. It contains four rows of settings for grouping. The first row is for 'Group By', which is set to 'Deptno'. The other three rows are for 'Then By' and are currently empty. For each row, there are radio buttons for 'Group above' (selected) and 'Group left'. To the right of each row are checkboxes for 'Data already sorted' (all unchecked) and a 'Break:' dropdown menu (all set to 'No Break'). At the bottom of the dialog are four buttons: 'Cancel', 'Back', 'Next', and 'Finish'.

Group By	Then By	Then By	Then By
Deptno			
☒ Group above ☐ Group left	☒ Group above ☐ Group left	☒ Group above ☐ Group left	☒ Group above ☐ Group left
☐ Data already sorted	☐ Data already sorted	☐ Data already sorted	☐ Data already sorted
Break: No Break	Break: No Break	Break: No Break	Break: No Break

Buttons: Cancel, Back, Next, Finish

Step 12: Sort the Data by EMPNO (Ascending)

In the sorting step of the Table Wizard, set Sort By to Empno with Ascending order so records appear in the correct sequence within each group.

Step 13: Review the Inserted Table in the Word Template

After finishing the wizard, review the table that BI Publisher inserts into the Word document. It shows the DEPTNO group header and the field placeholders for each column.

group G_EMPNO by DEPTNO

DEPTNO

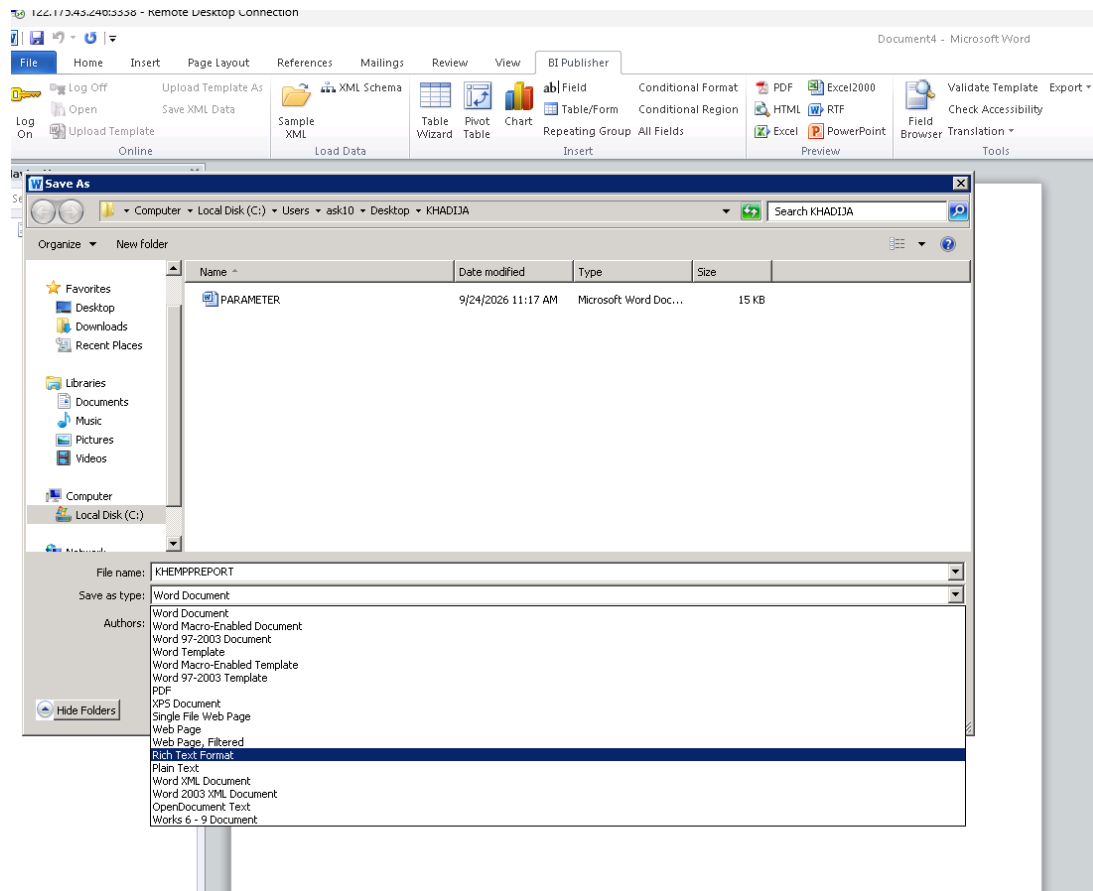

Empno	Ename	Job	Mgr	Hiredate	Sal	Comm
F EMPNO	ENAME	JOB	MGR	HIREDATE	SAL	COMM E

end G_EMPNO by DEPTNO

|

Step 14: Save the Template as Rich Text Format (.rtf)

Save the Word document using Save As, and choose Rich Text Format as the file type so it can be uploaded as the RTF template for the report.

Step 15: Preview the Report Output

Generate a preview of the report output to confirm that the parameter-based report renders correctly with the grouped and sorted data.
