

Based on Master-Detail Report

BI Publisher / Oracle EBS – Step-by-Step Guide

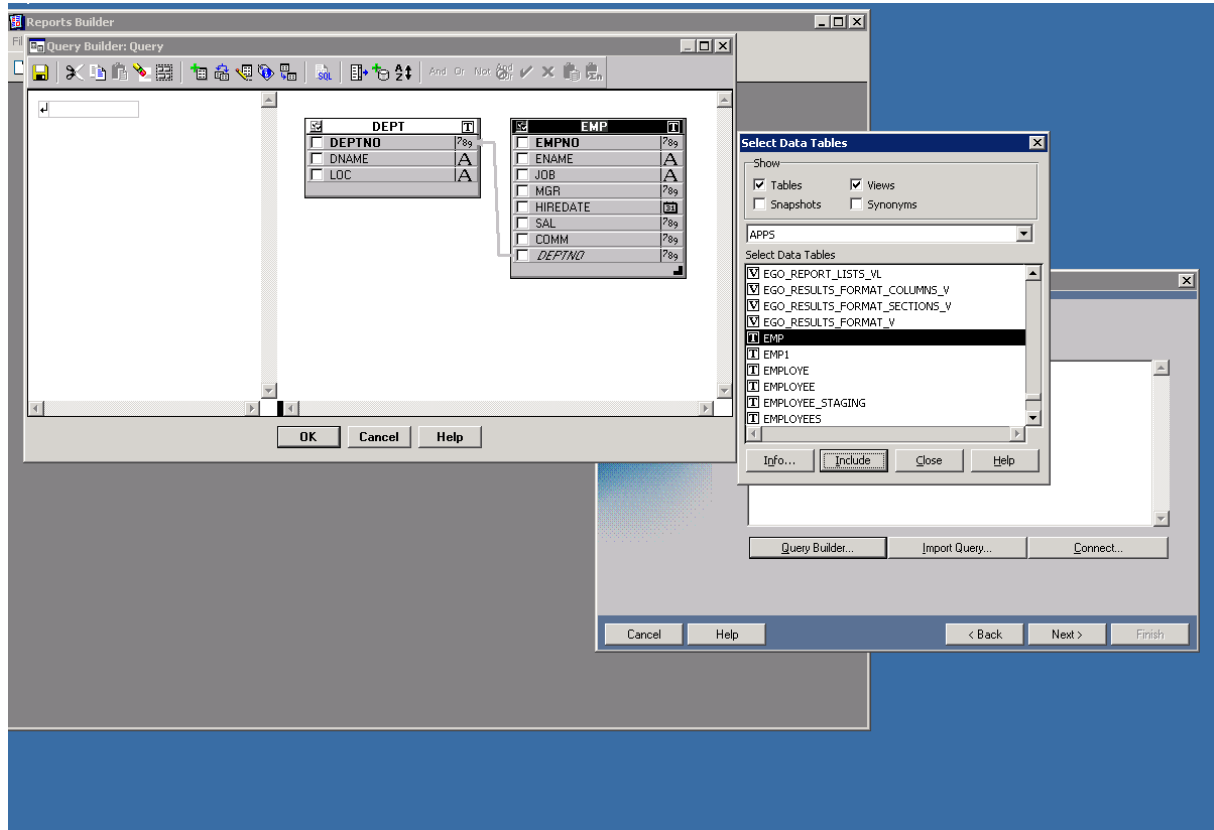

Step 1: Choose the Report Style

In Reports Builder, start the Report Wizard, enter a title (e.g. MASTER DETAILS REPORT), and choose Group Above as the report style so the report is laid out as a master record with its related detail rows underneath.

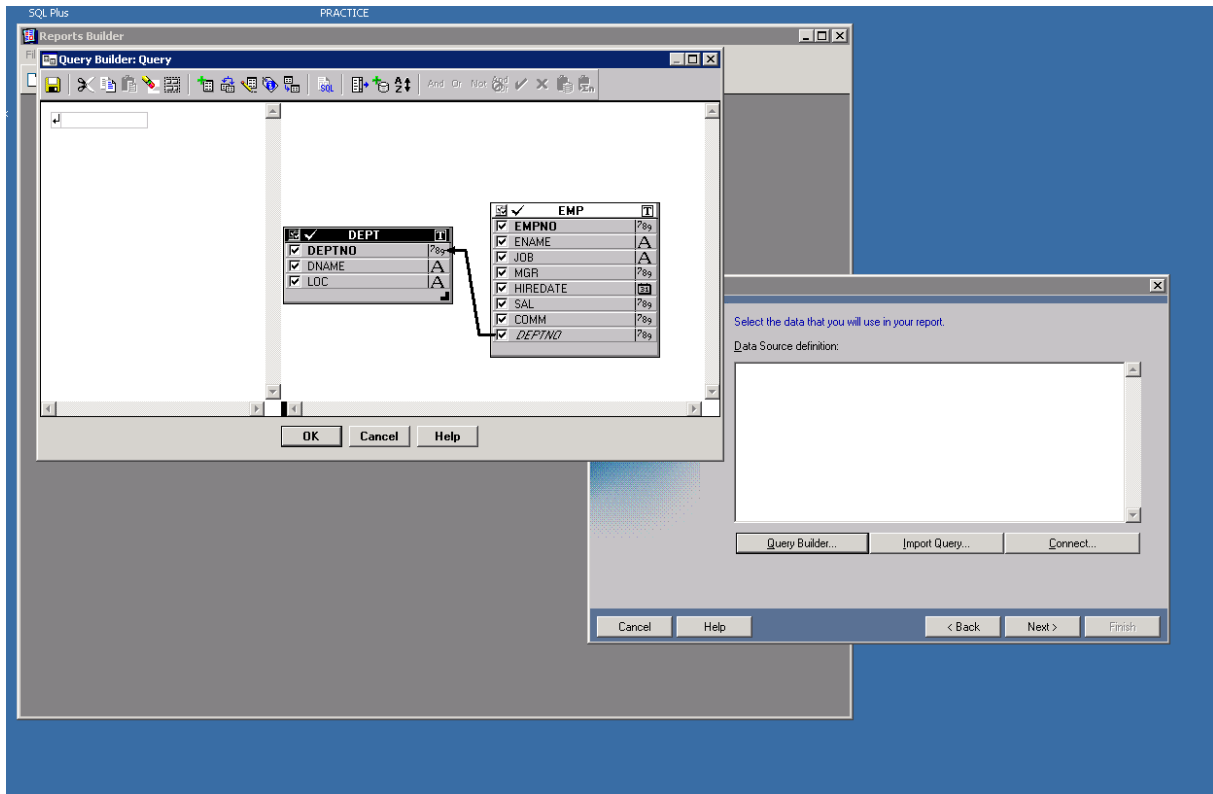

Step 2: Select the Data Tables

Open the Select Data Tables dialog and include the EMP and DEPT tables, since the master-detail report needs data from both the department (master) and employee (detail) tables.

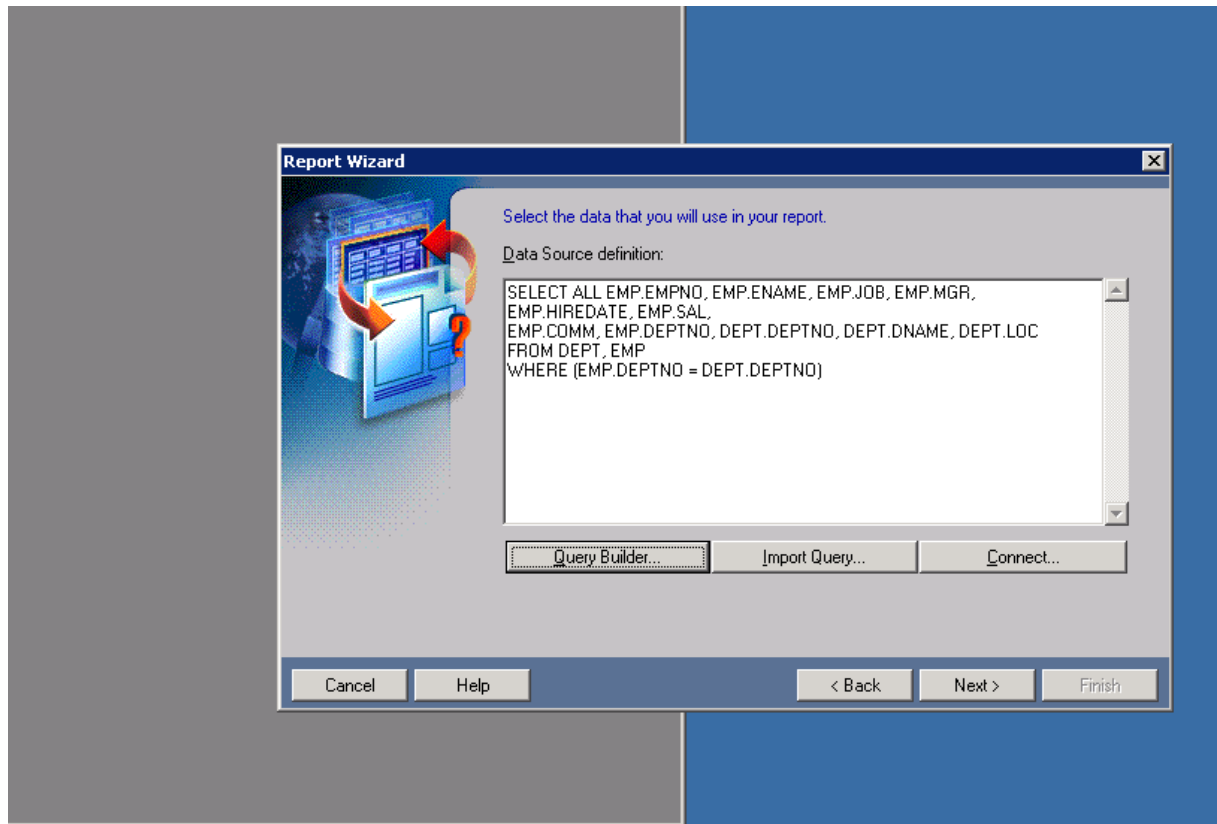

Step 3: Create the Relation Between the Tables

In the Query Builder, link the DEPT and EMP tables on DEPTNO to create the relation. This join defines how each employee (detail) connects back to its department (master).

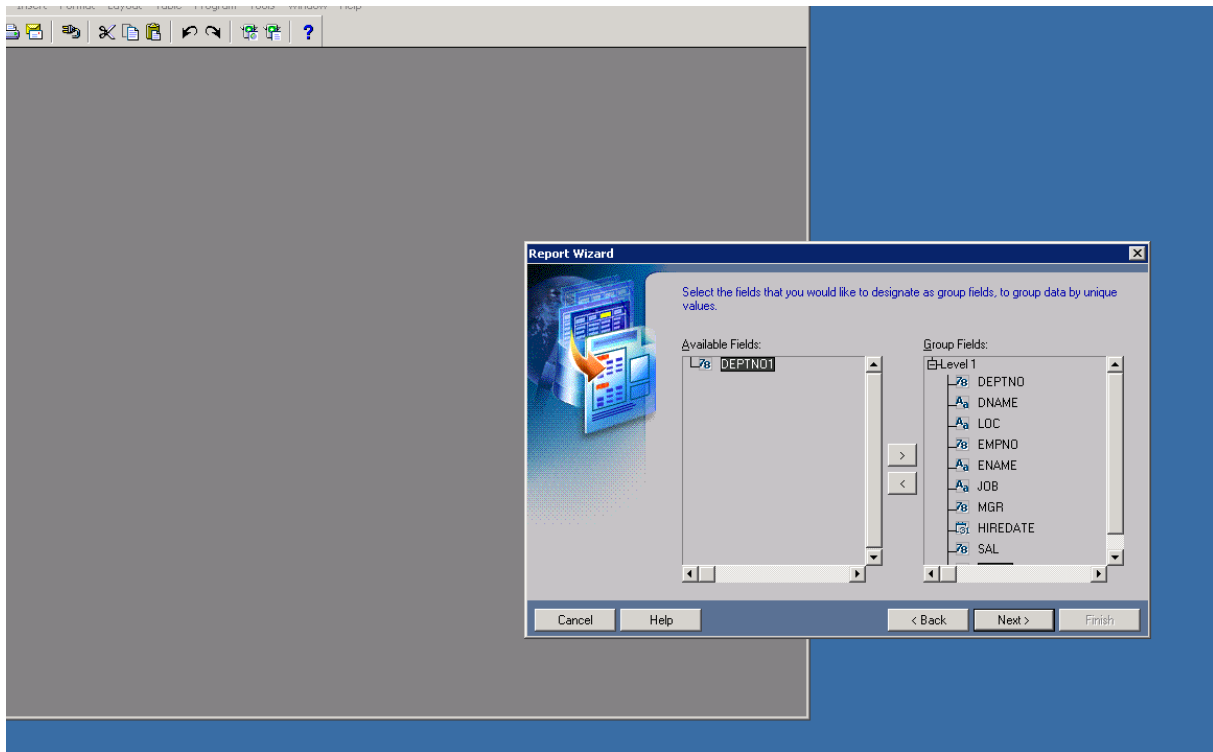

Step 4: Review the Generated Data Source Query

The Report Wizard builds the SQL query from the tables and join, selecting all the required columns from EMP and DEPT. Review this query before continuing.

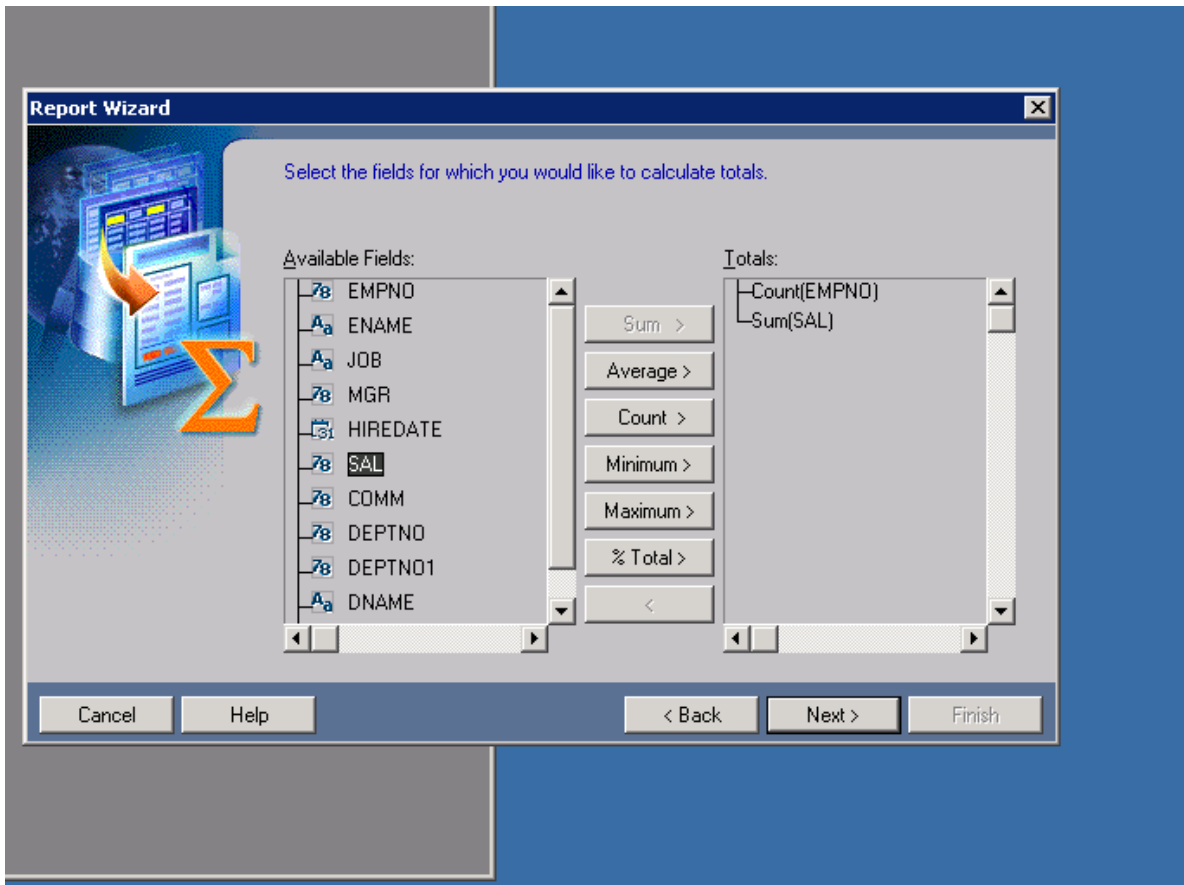

Step 5: Select the Group Fields

Choose the fields that will make up the report grouping. Move the department fields (DEPTNO, DNAME, LOC) and the employee fields into Level 1 so the data is grouped correctly for the master-detail layout.

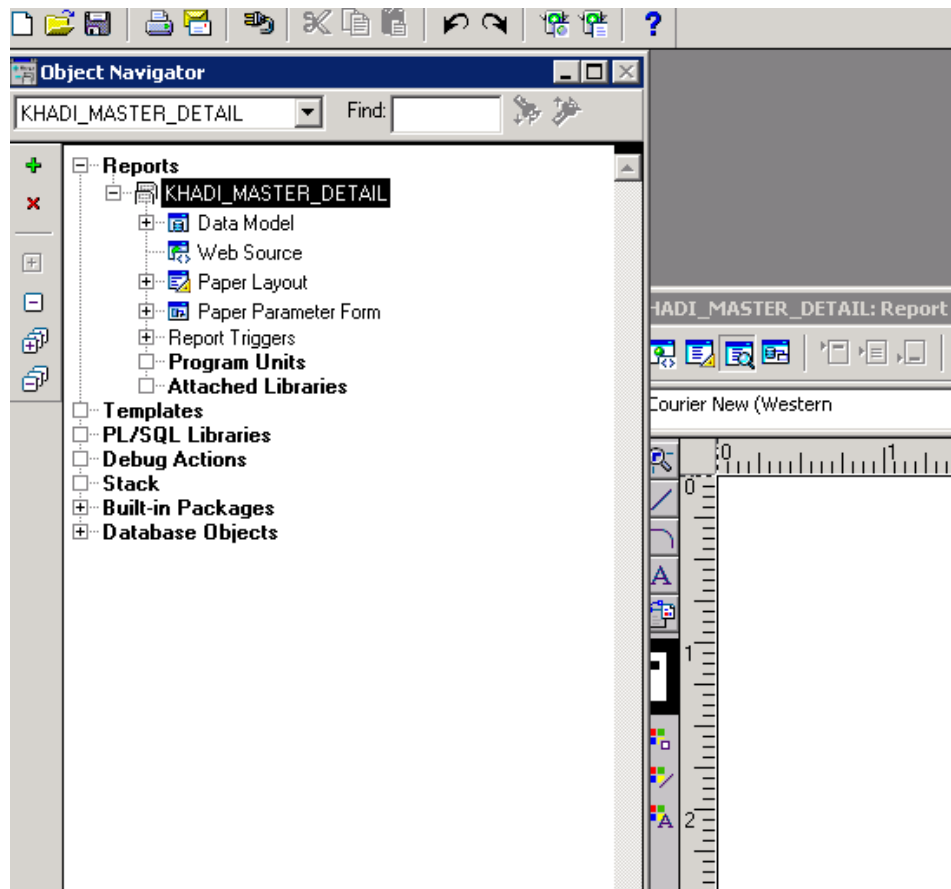

Step 6: Select the Totals

Choose the fields to calculate totals for, such as Count(EMPNO) and Sum(SAL), so the report shows a count of employees and a salary total for each group.

Step 7: Review the Report in the Object Navigator

Once the wizard finishes, the new report object (e.g. KHADI_MASTER_DETAIL) appears in the Object Navigator with its Data Model, Paper Layout, and Paper Parameter Form nodes.

Step 8: Define the Concurrent Program Executable

In Oracle Applications, create the Concurrent Program Executable, set the Execution Method to Oracle Reports, and enter the Execution File Name matching the report (KHADI_MASTER_DETAIL).

The screenshot shows the 'Concurrent Program Executable' dialog box. The fields are filled as follows:

- Executable: KHADI_MASTER_DETAIL
- Short Name: KHADI_MASTER_DETAIL
- Application: Application Object Library
- Description: (empty)
- Execution Method: Oracle Reports
- Execution File Name: KHADI_MASTER_DETAIL
- Subroutine Name: (empty)
- Execution File Path: (empty)

Buttons: 'Stage Function Parameters' and 'Open'.

Step 9: Define the Concurrent Program

Create the Concurrent Program and link it to the executable. Set the Output Format to XML so running the program produces an XML data file for the report.

The screenshot shows the 'Concurrent Programs' dialog box. The fields are filled as follows:

- Program: KHADI_MASTER_DETAIL (Enabled)
- Short Name: KHADI_MASTER_DETAIL
- Application: Application Object Library
- Description: (empty)

Executable

- Name: KHADI_MASTER_DETAIL
- Method: Oracle Reports
- Options: (empty)

Request

- Type: (empty)
- Incrementor: (empty)
- MLS Function: (empty)
- ☒ Use in SRS
- ☐ Run Alone
- ☐ Enable Trace
- ☐ Recalculate Default Parameters
- ☐ Allow Disabled Values
- ☒ Restart on System Failure
- ☒ NLS Compliant

Output

- Format: XML
- ☒ Save (S)
- ☒ Print
- Columns: (empty)
- Rows: (empty)
- Style: A4
- ☐ Style Required
- Printer: (empty)

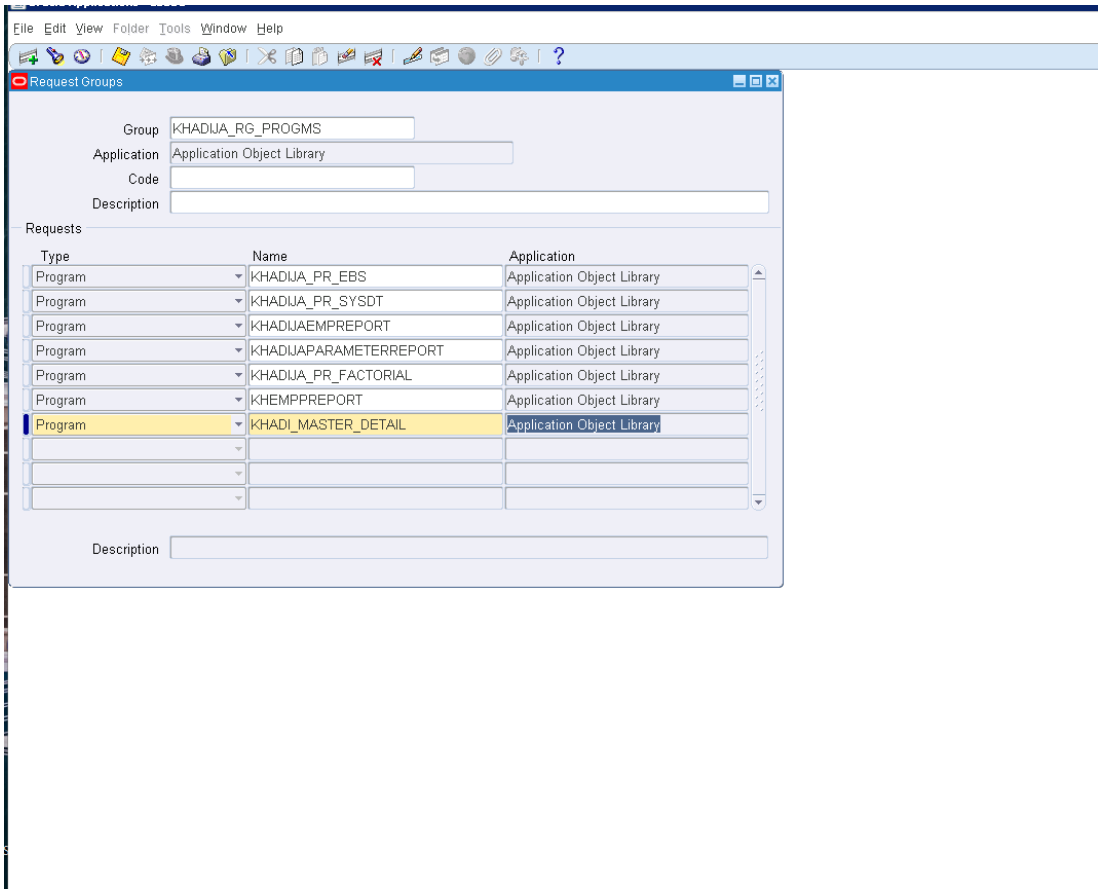

Business Events

- ☐ Request Submitted (Y)
- ☐ Request On Hold
- ☐ Request Resumed
- ☐ Request Running
- ☐ Program Completed
- ☐ Post Processing Started
- ☐ Post Processing Ended
- ☐ Request Completed (Z)

Buttons: 'Copy to...', 'Session Control', 'Incompatibilities', 'Parameters (G)'.

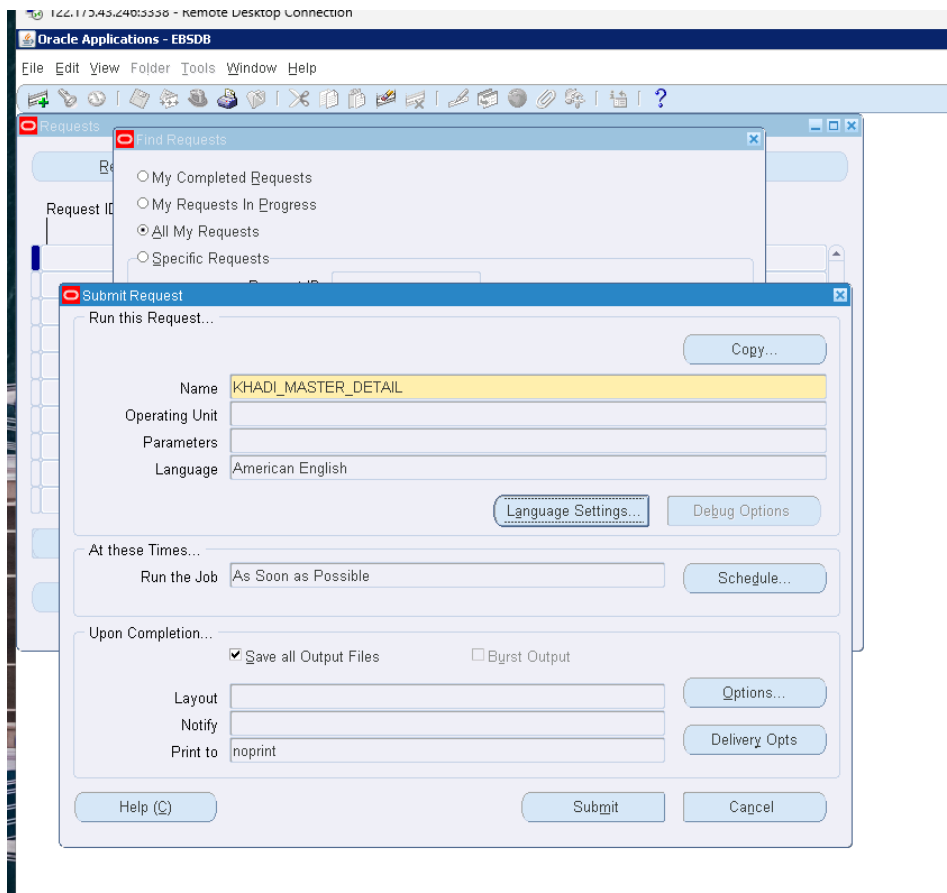

Step 10: Add the Program to a Request Group

Attach the new concurrent program (KHADI_MASTER_DETAIL) to the relevant Request Group so it becomes available to run from the Requests window.

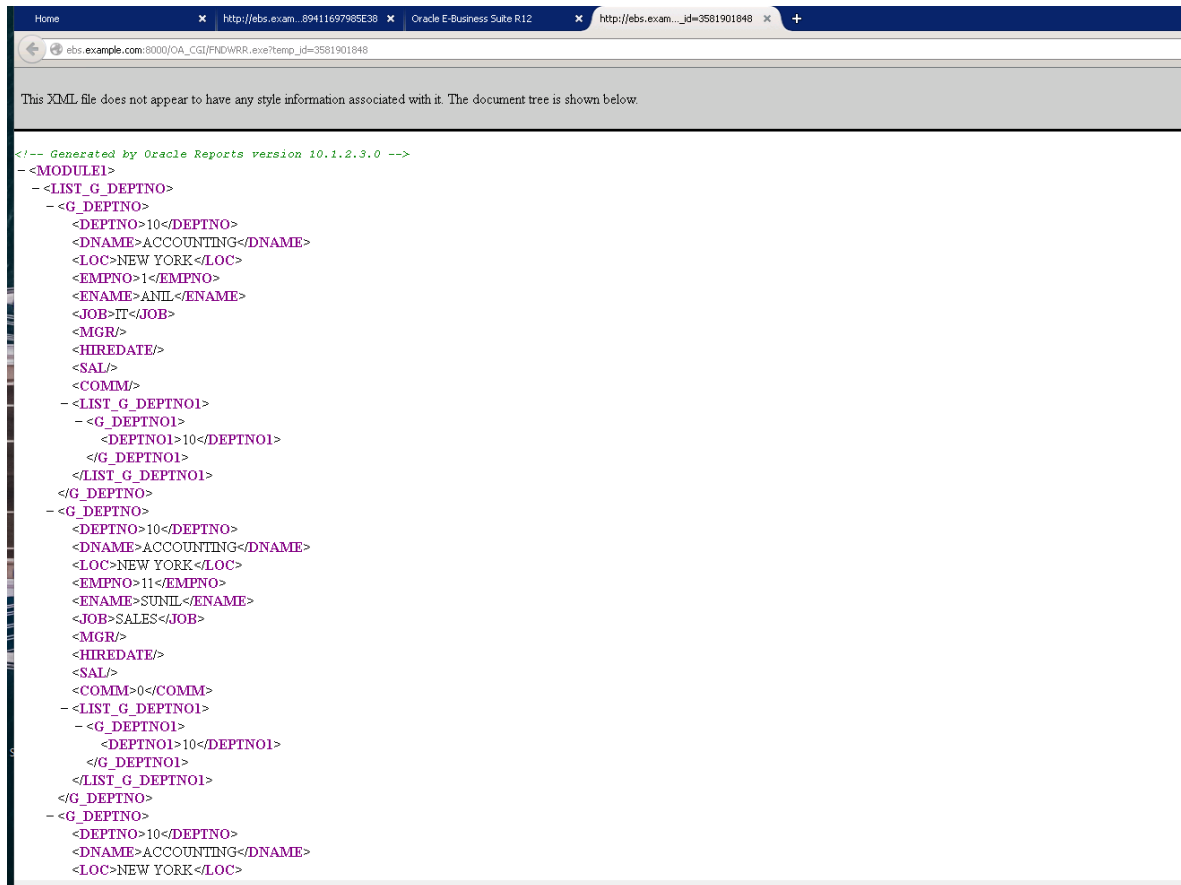

Step 11: Submit the Request

From the Requests window, submit a new request for KHADI_MASTER_DETAIL and run it as soon as possible, saving all output files.

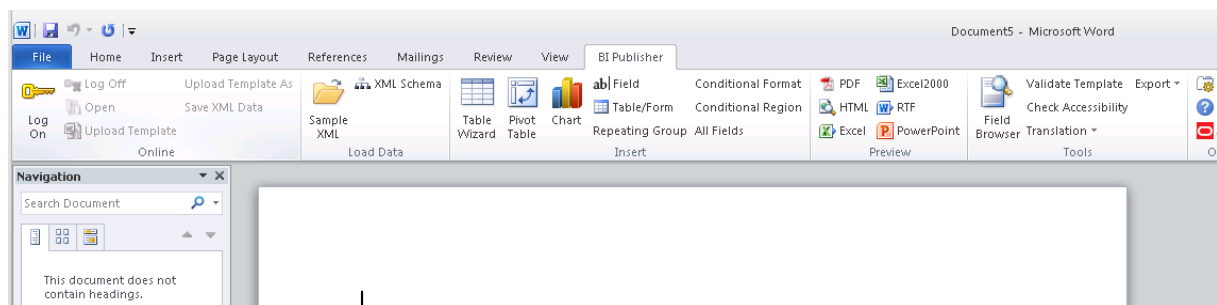

Step 12: View the Generated XML Output

Once the request completes, open the XML output file. It shows the master records (G_DEPTNO) each containing their related detail records (G_DEPTNO1), confirming the master-detail structure.

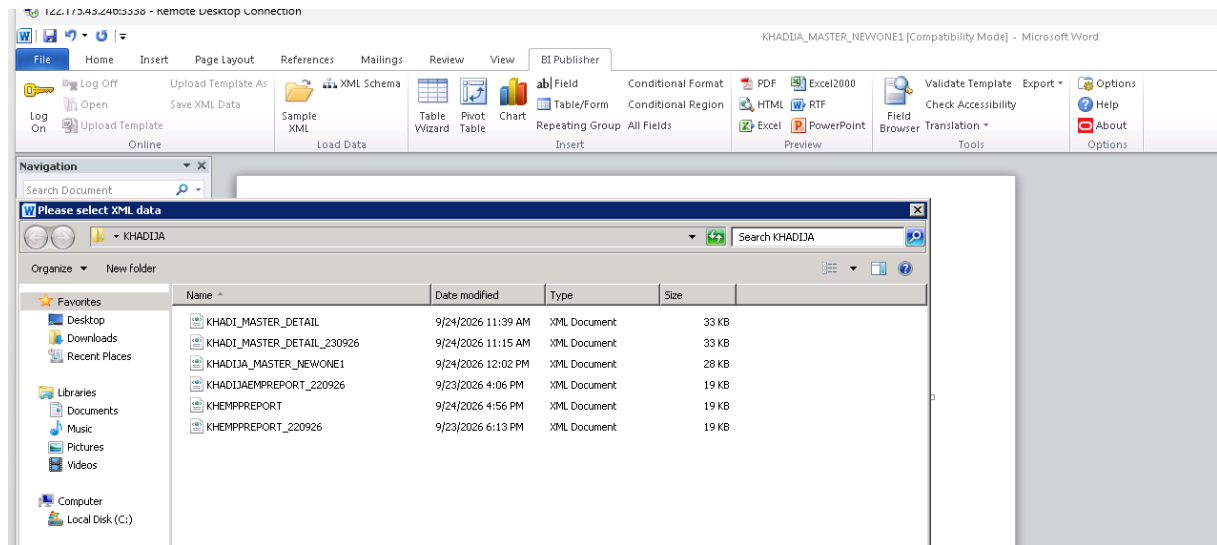

Step 13: Open MS Word and Access the BI Publisher Ribbon

Open a new document in MS Word. With the BI Publisher Desktop add-in installed, the BI Publisher ribbon tab appears, giving access to Sample XML, Table Wizard, and the report preview options.

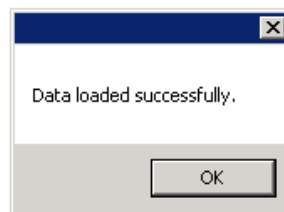

Step 14: Load the Sample XML Data

From the BI Publisher ribbon, click Sample XML and browse to the XML file generated by the master-detail concurrent program (e.g. KHADI_MASTER_DETAIL), then select it to load as the sample data.

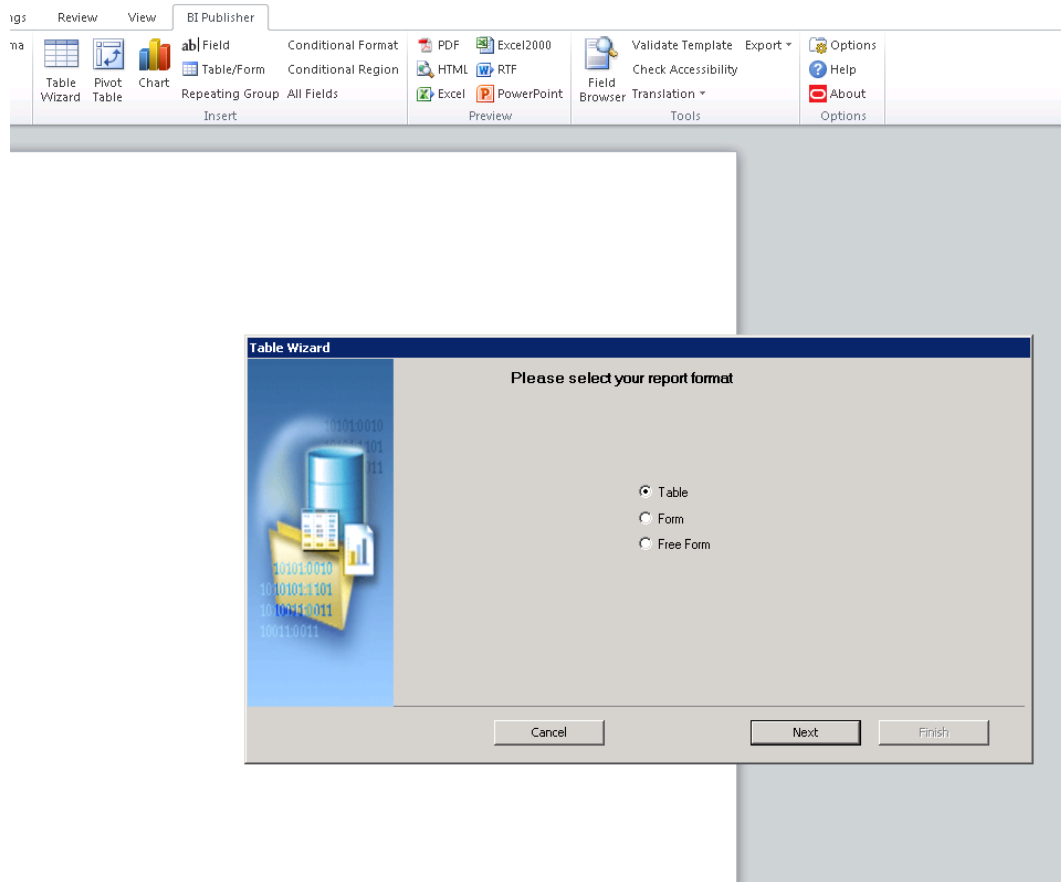

Step 15: Confirm the Data Loaded Successfully

A confirmation message appears once the XML data has been loaded into the template.

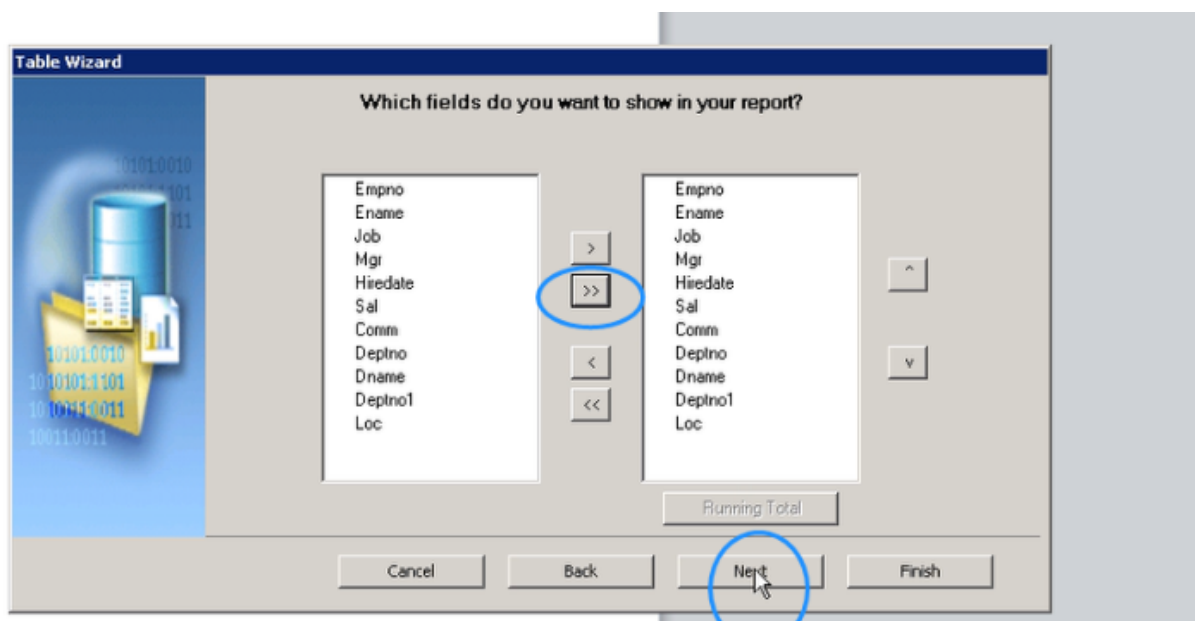

Step 16: Launch the Table Wizard and Select the Report Format

Open the Table Wizard from the BI Publisher ribbon and choose Table as the report format for the layout.

Step 17: Select the Fields to Show in the Report

Move all the required fields (Empno, Ename, Job, Mgr, Hiredate, Sal, Comm, Deptno, Dname, Deptno1, Loc) into the selected list so both the master (department) and detail (employee) fields appear in the report.

Step 18: Review the Final Report Output

Preview or run the report to PDF to confirm the master-detail report displays each department with its employees grouped correctly underneath.
